TOOLS TO INFORM ENERGY INVESTMENT PLANNING

*Parity Projects offers a unique options assessment service, designed to equip your team with the **clear incisive analysis** you need to incorporate the most suitable **energy saving measures** into your **housing stock investment strategy**.*

To discuss more about our stock assessment software call one of our analysts to find out what we can do for you. At all times we offer independent support as we are not commercially affiliated with any suppliers or manufacturers.

stock investment planning

Our bottom-up approach is designed to:

- Develop stock profiles in terms of the current energy performance of the housing
- Project installation costs and energy performance improvements for each measure identified
- Present a ranked listing of measures according to various priorities such as carbon savings, payback, SAP improvement, and resident fuel bill savings
- Present current and scenario whole stock carbon footprint / energy usage estimates

analysis

Our software has an extensive library of energy saving measures and housing archetypes for our analysts to choose from, as well as the ability to build custom initiatives and archetypes to meet all of our clients' needs.

Clients can choose to use our up-to-date, market-researched installation cost data or provide cost data from their existing framework agreements.

Our approach allows us to assess the entire stock as well as focus on subsets with special criteria, such as dwellings with low SAP scores or in CESP areas.

Our analysis can also target fuel poverty by identifying those homes most at risk.

survey services

We also offer our clients data verification, data cloning, and street or detailed surveying services to ensure an accurate current scenario is available for our model.

bespoke reports

Each report is unique and completed on a custom basis. A typical report might include:

- Rankings of total potential and cost effect of each type of measure
- Graphical representation of the results to easily identify the most pertinent initiatives
- What-if scenarios as specified by the client
- GIS correlation and mapping as required
- Detailed data as required in appended spreadsheets
